http://www.kazusa.or.jp/kaos/cgi-bin/agd_graph.cgi?c-MOA2 Genes with similarity to proteins in the databases are described in 'product' or 'note' qualifiers. Genes that have no significant protein similarity are described as 'unknown protein'. The software programs used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory, http://compbio.ornl.gov/Grail-1.3/), GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html), NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and SplicePredictor (Volker Brendel, Stanford University, http://gremlin1.zool.iastate.edu/cgi-bin/sp.cgi). Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Washington University School of Medicine, St. Louis, http://genome.wustl.edu/eddy/tRNAscan-SE/). This sequence may not be the entire insert of this clone. It may be shorter because we remove overlaps between neighboring submissions. The 5' clone is MLN21 and the 3' clone is MIE1.	2 (bases 1 to 52232) 2 (bases 1 to 52232) Sato,S., Nakamura,Y., Kaneko,T., Kato,T., Asamizu,E. and Tabata,S.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               http://www.tigr.org/softlab/glimmerm_htm/glimmerm.html, and Genesplicer (Mihaela Pertea and Steven Salzberg, contact mpertea@tigr.org), searches of the complete sequence against a peptide database and the plant EST database at TIGR (http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as unknown proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as hypothetical proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wusstl.edu/eddy/tRNAscan-SE/). Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RM/RepeatMasker.html).

The invention relates to neoxanthin cleavage enzymes and their corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key corle in endogenous abscisic acid (ABA) biosynthesis under drought stress. CC Neoxanthin cleavage enzyme is used for improving stress tolerance in a plant by plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by cc introducing the DNA into the plant, and a transgenic plant into which a cneoxanthin cleavage enzyme is introduced. The improvement of stress cotolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid land can be improved by growing transformant weed for several years and then removing the weed by specifically lowering stress tolerance in the weed by inducing an inducible promoter. The present cDNA sequence encodes Arabidopsis thaliana neoxanthin cleavage enzyme, AtNCED3 protein.

The AtNCED3 cDNA is obtained from an Arabidopsis plant-derived cDNA library using a cDNA of the CPRD65 (CowPea Responsive to Dehydration) energy can be isolated from cowpea plant as a probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match 100
